**Heegaard Diagrams and Holomorphic Disks**

Heegaard Floer homology is an invariant for closed, oriented three-manifolds defined by counting holomorphic disks in an associated symplectic manifold. There is also a closely related knot invariant, knot Floer homology. I will describe recent progress in combinatorial calculations of some of these invariants, with a focus on the case of classical knots, along with some applications. The talk will include joint work with Ciprian Manolescu, Sucharit Sarkar, Andras Stipsicz, Zoltan Szabo, and Dylan Thurston.
